Basic methods used in research of tourist issues

Science provides for people clear and sharp view of reality. Science aim is to accumulate knowledge and describing the mechanism of its creation and their rights, which govern it. We need to remember, that the growth of science is a social phenomenon, which has an influence on all aspects of life. Science feature is searching the generalization and afterwards applying suitable scientific method. This way of conduct allows gain recognition of a scientific claim. The main aim of science is giving general knowledge about each subject in accordance with theoretical rules. The theory can develop as a result of the connections with practical sciences. The practical sciences allow creation of their own theoretical basis.

The subject of this article is defining the research areas and analysis of basic methods used in research of tourist issues. This target will be realized by: presentation of the main rules of constructing searching trial, elaboration of the most popular searching methods (survey and statistic method) and diagnose the areas where other part of science are interested in tourism.
